CAR CRASH JAPANESE STANDARD

The original Standard in Japanese is to be final authority.

In the event of any doubt arising,

3. Testing method Using prescribed test equipment, install the sample on it in normal operating condition and conduct tests on conditions specified in Table 2 to examine humidity resistance, waterproof, drainage or change in overall function.

Type of test	Symbol of test	Purpose of test	M	Rain test	R1	The test to investigate the function of the parts subjected to droplets.	S1	Spray test	S2	The test to investigate the function of the parts subjected to heavy water spray.	D1	Dip test	D2	The test to investigate the function of the parts subjected to occasional water immersion.	D3	Waterproof parts of special application.	
			M	M1	M2	The test to investigate the function of the parts subjected to moisture.	R2	R1	R2	The test to investigate the function of the parts subjected to indirect wind and rain or spray.	S1	S2	D1	D2	D3	Waterproof parts of special application.	

Table 1

2. Type and symbol of tests The type and symbol of the tests shall be in accordance with Table 1.

- (1) Tests aimed at whether resistance and/or corrosion resistance.
- (2) Tests aimed at examining water pressure, air tightness or leak irrespective of circumference moisture, rain, spray condition of the parts.

1. Scope This Japanese Industrial Standard specifies the methods of moisture resistance test and waterproof tests for automobile parts (hereafter referred to as "parts"), with the exception of the following tests:

Method of moisture, rain and spray test  
for automobile parts  
D 0203-1994

JAPANESE INDUSTRIAL STANDARD JIS

Table 2

Symbol of test	Water pressure at rain or spray nozzle (gauge pressure) MPa	Dimension of rain or spray nozzles mm	Number of rain or spray nozzles	Water flow rate l/min.)	Water temperature °C	Moisture condition	Temperature difference <sup>(1)</sup> between the sample and water °C	Test time	Test procedures
M1	—	—	—	—	Approx. 32 of air, droplet and water vapor mixture	Atmosphere	—	8 h	Rotate a sample around the horizontal axis at rate of 1.5 min <sup>-1</sup> .
M2	—	—	—	—	Approx. 60	—	—	1 h	—
R1	0.01	See Fig. 1	2	1.9	Ordinary temperature	—	—	10 min	See Remarks 1.
R2	0.03	See Fig. 1	2	3.2	Ordinary temperature	—	—	10 min	See Remarks 1.
S1	0.10	φ1.2	40	24.5	Ordinary temperature	—	—	30 min	See Remarks 1.
S2	0.30	φ1.2	40	39.2	Ordinary temperature	—	—	1 h	See Remarks 1.
D1	—	—	—	—	See Remarks 2.	—	—	5 min	Submerge a sample into water as far as its upper surface.
D2	—	—	—	—	—	—	—	10 min	Submerge a sample into water to a depth of 100 mm from its upper surface.
D3	—	—	—	—	—	—	—	Approx. 50	Submerge a sample into water to a depth of 100 mm from its upper surface.

Note<sup>(1)</sup> Temperature difference means that water temperature is higher than that of the sample.

Remarks 1. With regard to the rain test and spray test, the samples shall be mounted at a distance of approximately 400 mm from the flow pipe having rain nozzle or spray nozzle as shown in the following Fig. 1. And then, the flow pipe shall be rotated around the axis X-X at the rate of approximately 23 min<sup>-1</sup>.

Besides, the samples shall be rotated around the vertical axis at the rate of approximately 17 min<sup>-1</sup>. However, this procedure of rotating the samples may be omitted by agreement between the purchaser and supplier.

ASTM D529  
Standard Test Method  
for Water Absorption of Synthetic Resins

5. In the case of ones having air vents or drain holes in its structure, tests may be carried out with holes closed, if necessary.
4. In case where it is necessary, test may be repeated a number of times as agreed upon by the purchaser and supplier, based on the cycle of the test time specified in Table 2.
3. In the case of moisture test, a sealed case shall be used.
2. In the case of dip test D1, the water temperature shall be lower than at least 10°C, as compared with the temperature of the sample.
- Remarks 2. In the case of dip test D1, the water temperature shall be lower than at least 10°C, as compared with the temperature of the sample.
5. In the case of ones having air vents or drain holes in its structure, tests may be carried out with holes closed, if necessary.
4. In case where it is necessary, test may be repeated a number of times as agreed upon by the purchaser and supplier, based on the cycle of the test time specified in Table 2.
3. In the case of moisture test, a sealed case shall be used.
2. In the case of dip test D1, the water temperature shall be lower than at least 10°C, as compared with the temperature of the sample.

Designation	Shape and dimension of rain or spray nozzle	R1	R2	S1	S2

Unit: mm
